## **DIGITAL LITERACY & ICT – CASE STUDY REPORT**

*Domain: Digital Literacy & ICT*

---

**Student Name:** Shubham Gupta  
**Roll Number:** 2500030511  
**Village/Area:** WARD NO - 4 VILL- SANGRAHEKALAN  
**District:** GARHWA  
**Domain:** Digital Literacy & ICT  
**Problem Statement:** Lack of Basic Digital Literacy Skills  
**Duration:** 7 Days

### **2. Problem Description**

**What is the selected ICT/digital issue?:**

The selected ICT issue is the lack of basic digital literacy skills among people in the village. Many people have smartphones but do not know how to use digital services properly. They face difficulties while making online payments, using government service apps, searching information on the internet, and accessing online facilities.

**Where is it observed (specific households/areas)?:**

This issue was observed in Village Sangrahe Kala, District Garhwa, Jharkhand. It is commonly seen in several households, especially among elderly people, women, and villagers who have not received any digital training. Many residents are still dependent on others for digital tasks.

**Why is this problem important?:**

This problem is important because digital technology is becoming a part of everyday life. People need digital skills to access government schemes, make online payments, communicate with others, and obtain useful information. Without these skills, they may miss opportunities and face difficulties in their daily activities.

### **3. Number of Stakeholders Covered**

**Stakeholder 1 (Households):**

7

**Stakeholder 2 (Students):**

4

**Stakeholder 3 (Trainers):**

4

**Stakeholder 1 (Households) - Photo 1:**

During the household survey, I interacted with a community member to understand her level of digital literacy. Information was collected regarding smartphone usage, online payments, internet access, and awareness of digital services available in the village.

### Stakeholder 1 (Households) - Photo 2:

A discussion was conducted with a household member to identify challenges faced while using digital technology. The participant shared her experiences related to online services, digital payments, and access to information through smartphones.

### Stakeholder 2 (Students) - Photo 1:

A student was interviewed to assess her knowledge of digital tools and online learning resources. The discussion focused on smartphone usage, educational applications, internet access, and awareness of digital opportunities for students.

### Stakeholder 2 (Students) - Photo 2:

Interaction with a student helped in understanding the use of digital technology for education and communication. Information was collected about online learning, digital skills, and challenges faced while accessing educational resources.

### Stakeholder 3 (Trainers) - Photo 1:

A trainer was consulted during the survey to gather insights about digital literacy levels in the community. The discussion focused on common challenges, awareness gaps, and the need for digital education among villagers.

### Stakeholder 3 (Trainers) - Photo 2:

Discussion with a trainer provided valuable information regarding digital awareness and training requirements. The participant emphasized the importance of regular digital literacy programs to improve the community's confidence in using technology.

## 4. Survey Summary

### Total respondents:

15

### Stakeholder-wise distribution:

Households: 7, Students: 4, Trainers: 4

## **5. Data Analysis**

| Stakeholder | No. of Questions | Yes (%) | No (%) | Key Issue                                                                                                                                                                                                                         |
|-------------|------------------|---------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Households  | 8                | 50      | 50     | Most people in the households own smartphones, but they do not know how to use many digital services. They often face problems while making online payments, using government apps, or searching for information on the internet. |
| Students    | 6                | 39      | 61     | Students are familiar with smartphones and social media, but many of them are not aware of educational apps, online learning platforms, and other useful digital tools that can help in their studies.                            |
| Trainers    | 6                | 56      | 44     | According to trainers, the main issue is the lack of awareness and proper guidance. Many people are interested in learning digital skills but do not get enough opportunities for training and practice.                          |

## **6. Key Findings**

### **Major problems identified:**

During the survey, it was found that many people have basic smartphones but lack the knowledge to use them effectively. They face difficulties in digital payments, accessing online services, and using important mobile applications. Many are still not confident while using digital technology.

### **Impact of the Problems:**

Because of limited digital skills, people are unable to take full advantage of online services. They often miss useful information, government benefits, and learning opportunities. This also increases their dependence on others for simple digital tasks.

### **Root causes:**

The major reasons behind this issue include lack of awareness, limited access to digital training, low exposure to technology, and insufficient guidance. Many people have never received formal instruction on using smartphones, digital applications, or internet-based services effectively and safely.

## **7. Field Observations**

### **Device usage patterns:**

Most respondents use smartphones mainly for making calls, sending messages, watching videos, and using social media applications. Only a small number of people regularly use their devices for educational purposes, online payments, accessing government services, or other productive digital activities.

### **Internet availability:**

Internet connectivity is available in most areas of the village, but the quality of service varies from place to place. Some respondents reported network issues and slow internet speeds, which often create difficulties while accessing online services and digital learning resources.

**Skill gaps:**

Many respondents lack basic digital skills such as creating online accounts, downloading and using applications, making digital payments, accessing government websites, and protecting themselves from online fraud. These skill gaps limit their ability to use digital technology effectively.

**Dependency on others:**

A large number of villagers depend on family members, friends, students, or local shopkeepers for completing digital tasks. They often require help for online payments, filling online forms, accessing government services, and understanding how different mobile applications work.

## **8. Impact Analysis**

**Impact on education:**

Students with limited digital knowledge face difficulties in accessing online learning resources, educational videos, digital classrooms, and study materials. This limits their learning opportunities and affects their ability to develop important digital skills needed for future academic success.

**Impact on employment:**

Digital literacy has become an important requirement for many jobs. Lack of digital skills reduces employment opportunities and makes it difficult for people to search for jobs online, submit applications, access training programs, and improve their professional skills.

**Impact on daily life:**

Digital technology is now a part of everyday life. Without proper digital skills, people face challenges in making payments, accessing government schemes, booking services, obtaining information, and communicating efficiently, which affects their daily convenience and independence.

## **9. Student Intervention**

**Activity conducted:**

A digital literacy awareness activity was conducted in the village to educate community members about smartphone usage, online payments, internet safety, digital services, and the importance of digital skills. Participants were encouraged to learn and use digital tools confidently.

**Target group:**

The activity mainly targeted household members, students, and other villagers who had limited digital knowledge. Special attention was given to people who faced difficulties in using smartphones, online services, and digital applications in their daily lives.

### Number of participants:

A total of fifteen participants were involved in the survey and awareness activities. The group included seven household members, four students, and four trainers. Their responses and participation helped in understanding the digital literacy challenges faced by the community.

### Immediate outcomes:

After the awareness session, participants showed greater interest in learning digital skills. Many gained basic knowledge about online payments, internet safety, and smartphone usage. They also expressed confidence and willingness to use digital services more independently in the future.

### Student Intervention - Photo 1:

A group discussion session was conducted with community members to understand their awareness of digital literacy and online services. Participants shared their experiences and challenges related to smartphone usage, internet access, and digital payments. The discussion also highlighted the need for regular digital literacy training in the village.

## Student Intervention - Photo 2:

A digital literacy awareness activity was organized with local community members. Information was shared about smartphone usage, online payments, government digital services, and internet safety. Participants actively engaged in the discussion and showed interest in improving their digital knowledge and skills.

## 10. Recommendations

### Short-term solutions:

Regular awareness programs, workshops, and practical training sessions should be organized to improve digital literacy. Community members should be provided with simple guidance and hands-on experience so they can confidently use smartphones and online services.

### Long-term solutions:

Long-term efforts should focus on establishing digital learning centers, providing continuous training opportunities, and integrating digital literacy education into community development programs. This will help people build confidence and improve their digital skills over time.

### Government/community suggestions:

The government, schools, and local organizations should work together to organize digital literacy campaigns and training programs. Better internet connectivity, awareness initiatives, and access to affordable digital resources can help improve digital literacy in rural communities.

## 11. Conclusion

### Summary of findings:

The survey and field observations revealed that lack of basic digital literacy is a major challenge in Village Sangrahe Kalan. While most respondents own smartphones and have access to internet services, many are not comfortable using digital tools independently. Common issues included difficulty in making online payments, accessing government services, using educational platforms, and understanding online safety practices. The study also found that many people depend on family members or others for digital tasks. The findings clearly indicate that awareness, practical training, and continuous support are required to improve digital literacy and promote effective use of technology in the community.

**Future scope:**

The findings of this study provide a strong foundation for future digital literacy initiatives in the village. Regular training programs, awareness campaigns, and practical learning sessions can help community members develop confidence in using digital tools and services. Schools, local organizations, and government agencies can work together to promote digital education and safe internet practices. In the coming years, improved digital literacy can help people access better educational resources, employment opportunities, government schemes, healthcare information, and financial services. This will contribute to the overall social and economic development of the community and help create a more digitally empowered society.
